                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                           The present invention describes a fragment complementation system (I) CC which comprises a first oligopeptide (OP1) containing an N-terminal CC fragment with a C-terminal break point and a second oligopeptide (OP2) CC comprising a C-terminal with a N-terminal breakpoint, in which the C and CC N terminal fragments are both derived from a marker protein (MP) and CC reassemble to form a functionally reconstituted MP. Methods from the CC present invention are used for monitoring the occurrence of protein. CC protein interactions in a sample, identifying oligopeptide interactions CC protein interactions in a sample, identifying oligopeptide interactions CC protein interactions in a sample, identifying interactions between a maximum superior of a transmentance protein and a polypeptide, for compounds that bind to an extracellular domain of a transmentance protein and a polypeptide, for regulated signal transducers, forming a enzyme complementation system for selecting simultaneous incorporation of multiple genetic elements into a fost cell and for activating a beta-lactam derivative of an antitumour compound in a host who is in need of it. The present sequence represents the tell first in factor of the Becherichia coli mature TEM-1 beta-lactamase, which is used in the
                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                CC a first oligopeptide having an N-terminal fragment with a C-terminal CC break-point, and a second oligopeptide having a C-terminal fragment with a C-terminal CC a N-terminal fragment with a C-terminal CC a N-terminal fragment with a C-terminal fragment and the C-CC terminal fragment each are derived from a marker protein and reasemble component of the component of the component of the component of the first and second oligopeptide to which a first oligopeptide binds, involving co-cxpressing the first and second oligopeptide results in the functional CC expressing the marker protein. The method is also useful for identifying a CC expressing the courrence of protein. The method is also useful for considering the occurrence of protein. The method is also useful for consitoring the occurrence of protein. The method is also useful for consitoring the occurrence of protein protein interactions in a sample; CC and identifying epitopes that bind to an immunoglobulin variable region. CC (I) or an expression casette (II), encoding a selectable N or C-terminal component of a transmembrane protein and a polypeptide, where the cc inhibit, chosmonorylation is an immune cell protein, preferably CD40. (I) or consistent of high-throughput identification of compound that consistent consistency of the consistency of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fragment complementation system for detecting immunoglobulin epitope, has first oligopeptide containing N-terminal fragment with C-terminal break-point, second oligopeptide containing C-terminal fragment with N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    functional reassembly; protein-protein interaction; proteome interaction;

                                                     The intracellular form (AAW18680) of TEM beta-lactamase is expressed by pCMV-delBL (AAT70311) in which a PCM-amplified beta-lactamase coding sequence, minus the signal sequence, is placed under control of the intermediate/early promoter of cytomegalovirus. Intracellular beta-lactamase constructs, placed under control of promoter/enhancer elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or inflammation.

Secretion of the enzyme has the advantage of increasing neighbouring cell
                                                                                                                                                                                                                                                                          DNA construct for gene-directed enzyme prodrug therapy of lung cancer comprises lung- or neuroendocrine-specific promoter controlling expression of prodrug-converting enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dev
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

The expression constructs pRNH127 and pRNH155 contain identical sequences but were constructed using different strategies (see AAQ36498). The constructs comprise exons 2-7 of human CYP1A1 gene under the construct of the inducible mouse metallothionein (MMT-1) promoter. The constructs also contain an open reading frame in the opposite orientation to the cytochrome P450 exons. This ORF encodes ampicillin resistance. The constructs are suitable for transformation of human fibroblasts derived from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the transformed from the xeroderma pigmentosum group A. Cultures of the xeroderma pi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the inducible cytochrome P450 gene allows metabolism of the substance to mutagenic metabolites. (Updated on 10-MAR-2003 to add missing OS field.)
                       A secretory beta-lactamase (AAR97619) is expressed from DNA construct pCMV-BL (AAT29220), in which the beta-lactamase coding sequence is under the control of the intermediate/early cytomegalovirus promoter. Beta-lactamase delivery to mammalian cells confers sensitivity to cephalosporin prodrugs. Liposomal DNA/5-fluorouracil prodrug combinations resulted in s.c. tumour regression in mice bearing As49 tumours. Survival of mice bearing human large cell lung H460 intrathoracic (i.t.) tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gene therapy; gene directed enzyme prodrug therapy; GDEPT; virus directed enzyme prodrug therapy; VDEPT; prodrug activation; cytotoxic; cytostatic; cancer; tumour; retrovirus; vector;
                                                                                                                                                                                                                                                                                                              Molecular chimaera for use in enzyme gene therapy - is activated target cell to express a secretable enzyme which cleaves a prodruoutside the cell into a cytotoxic or cytostatic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR97619

The present sequence is encoded by a chimeric mouse metallothionein-cytochrome P450IAI (CYPIAI) expression construct. Two clones, pRNH127 and pRNH15, were isolated by different methods and which both had the same sequence. The CYPIAI construct is used in assays to test for cytotoxicity of humans to a chemical. The method comprises exposing human fibroblast cells normally not including any cytochrome P450 activity to potentially toxic chemicals. The cells having been transformed to express cytochrome P450, under the control of a controllable promoter through the CYPIAI gene, upon exposure to the chemical in vitro. The chemical is metabolised intracellularly into a cytochrome metabolite by oxidation within the
                                                                                                                                                                                                                                                                                                                                            Testing chemicals for cytotoxicity to human by using recombinant fibroblasts transformed with control of inducible promoter.

                        Escherichia coli beta-lactamase (AAW16635), lacking the signal peptide, is the expression product of a molecular chimaera, designated pCMV-delBH (AAT66738), in which the beta-lactamase gene is under control of the CM intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Intracellular expression of the beta-lactamase i a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or
                                                                                                                                                                                                                                                                                                                             Molecular chimaera for useful for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09-AUG-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fibroblasts through the intracellular cytochrome P450 mixed function oxidase enyzmes expressed by the cells. Gene damage in the test cells is detected as an indication of cytotoxicity of the chemical. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                           Example;

The secreted form (AAW18679) of TEM beta-lactamase is expressed by BL (AAT70309) in which a PCR-amplified beta-lactamase coding sequen placed under control of the intermediate/early promoter of cytomegalovirus. Secretory beta-lactamase constructs, placed under control of promoter/enhancer elements of lung- associated protein of control of promoter/enhancer elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of promoter elements of lung- associated protein of the control of the cont

genes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
This invention describes a novel tetracycline assay that uses recombinant prokaryotic cells comprising a luciferase gene under the transcriptional control of a tetracycline repressor and tetracycline promoter and involves the detection of luminescence emitted form the cells. The assay can be used to distinguish tetracycline form other microbial agents. The invention also describes a novel plasmid comprising either the luxCDABE genes, a tetracycline repressor (TetR) and a tetracycline promoter (TetA) from Tn10, or the insect luciferase gene, a tetracycline assay and a tetracycline promoter (TetA) from Tn10. The tetracycline assay method can be used for the determination of tetracycline in a sample,

This invention describes a novel method for the selection of monoclonal antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma cells to produce antibody-producing hybridomas such that the antibodies are presented at the surface of the hybridomas by an antibody-binding protein (I); and (ii) binding the antibody to antigens (Ag). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g. to study the dosage and penetration of the medicine. The method can also be used to test cheese production, as cheese making bacteria are not able to work in the presence of tetracycline. The method can also be used to determine the presence or concentration of antibiotics in foodstuffs, e.g. for allergic people. The present assay method does not rely on the growth of microbes as do conventional tests, and so is much more rapid. The present assay is also more sensitive, as even a small amount of luminescence can be detected
                                                                                                                                 Selecting monoclonal antibodies, by expressing them on the surface hybridomas attached to antibody-binding protein, then reaction with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) molecule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of PDGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex mixtures of hybridomas can be used for selection, reducing the time and cost involved in MAb selection. This sequence represents the bla protein protein contained in the expression vector pSEX15G2 which contains the bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                   Selecting monoclonal antibodies, by expressing them on the surface of hybridomas attached to antibody-binding protein, then reaction with antibody library.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Breitling F,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Expression vector; antibody binding protein; monoclonal antibody; Neo-R; B lymphocyte; myeloma cell; hybridoma; protein G; bla protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB10438 standard; protein; 286

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        288888888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC thain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of plogFR (plattelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular CC contigens. MAb can be selected without separate culture of hybridomas, and CC cost involved in Mab selection. This sequence represents the Neo-R CC protein contained in the expression vector pSEXILL4 which contains the CC bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of PDGPR (platelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular CC antigens. MAb can be selected without separate culture of hybridomas, and CC cost involved in Mab selection. This sequence represents the time and CC cost involved in Mab selection. This sequence represents the bla protein CC bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 100.0%; Score 975; DB 3; Best Local Similarity 100.0%; Pred. The vector contains a surrogate promoter from Zymomonas mobilis, the celZ gene from Erwini chrysanthemi, resistance markers bla and tet, and Klebsiella oxytoca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           control of a surrogate promoter capable of increasing expression of the polysaccharase. The host cell also contains a second heterologous polymucleotide encoding a secretory polypeptide to facilitate the secretion of the expressed polysaccharase. The recombinant host cell is useful for producing polysaccharase which is useful for enzymatically degrading oligosaccharides such as lignocellulose, hemicellulose, cellulose, pectin or their combinations, and fermenting the product to ethanol, by simultaneous saccharification and fermentation processes. The present sequence is encoded by an integration vector which was introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is given in a specification relating to a recombinant host cell suitable for simultaneous saccharification ar fermentation. The host cell contains at least one heterologous polynucleotide encoding a polysaccharase under the transcriptional

Sequence 21, Application US/09263933

Patent No. 6280940

GENERAL INFORMATION:

APPLICANT: Potte, Karen E.

APPLICANT: Potte, Karen E.

APPLICANT: Patick, Amy K.

TITLE OF INVENTION: REPORTER GENE SYSTEM FOR USE IN CELL-BASED ASSESSMENT

TITLE OF INVENTION: OF INHIBITORS OF THE HEPATITIS C VIRUS PROTEASE

FILE REPERENCE: 0125-0005A

CURRENT APPLICATION NUMBER: US/09/263,933

CURRENT APPLICATION NUMBER: 09/129,611

EARLIER APPLICATION NUMBER: 09/129,611

EARLIER FILING DATE: 1998-08-05

NUMBER OF SEQ ID NOS: 33

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 21

LENGTH: 286

TYPE: PRT

ORGANISM: Artificial Sequence
